

1.Environment and AI toolchain

<https://github.com/haidersara/flyrank-frontend-capstone>

Here's a short summary of what you completed for "Environment and AI toolchain":

Setup:

- Used existing Node.js and Git installations; installed Cursor as your AI-powered IDE (free tier, no subscription needed).

Repo created:

- `flyrank-frontend-capstone` on GitHub (public), initialized with a README, MIT license, and a Node `.gitignore`.
- Added a `.cursor/rules.md` file describing the stack (Next.js, Tailwind CSS, React) and conventions (functional components, Conventional Commits, mobile-first design) — serving as your Cursor rules file in place of `CLAUDE.md`.

Commits (Conventional Commits format):

1. `Initial commit` (auto-generated by GitHub)
2. `chore: add cursor rules file`
3. `docs: improve README based on AI feedback`

AI critique step:

- Asked Cursor's AI to critique the README — it flagged the README as a placeholder missing purpose, tech stack visibility, getting-started instructions, and a link to conventions.
- Applied its suggested improvement: added a project description, a "Getting Started" section (prerequisites + setup commands), and a link to `rules.md`.

Deliverable submitted:

- Repo URL: <https://github.com/haidersara/flyrank-frontend-capstone>
- Screenshot of Cursor's AI performing the critique and generating the updated README, captured directly in the IDE.

Status: Submitted 

2. AI Workflow Audit and Tool Setup

AI Workflow Audit — Sara Haider

Front-end AI Engineering Track · FlyRank AI Internship · FL-02: AI Workflow Audit and Tool Setup

1. Recurring Task Audit

Task Classification Rationale

Debugging live 4over API integration issues (Bizcard Print Hub) Just me Requires cross-checking real supplier data and business judgment AI can't verify.

Writing/fixing Express + Drizzle ORM backend routes Collaborate with AI AI drafts logic fast, but I steer architecture and catch edge cases from the live data.

Writing SQL/schema migration scripts Delegate to AI with review AI generates boilerplate migrations reliably; I review before running against the DB.

Debugging Next.js frontend routing/UI wiringCollaborate with AI Back-and-forth needed since UI must exactly match a teammate's existing design.

Writing status updates/handoff docs for supervisor Delegate to AI with review AI drafts clearly from my notes; I edit for accuracy and tone before sending.

Writing commit messages (Conventional Commits) Fully automate Format is mechanical once the diff is described; low risk if occasionally imperfect.

Verifying supplier/category data against internal DB records Just me Needs manual cross-referencing of real numbers; mistakes here cause real bugs.

Godot/GDScript development for my solo game project Collaborate with AI AI helps with syntax and logic, but game feel and design decisions stay mine.

Reading and summarizing research papers for my FYP Delegate to AI with review AI summarizes fast; I verify against the source before citing anything.

Writing FYP documentation/reports Collaborate with AI I draft structure and content, AI helps tighten wording and catch gaps.

Manual browser/UI testing after a code change Just me Has to be done by hand to confirm the actual user-facing behavior works.

Studying/reviewing lecture material before exams Collaborate with AI AI is useful for quizzing and clarifying concepts, but understanding is on me.

Filling out internship/application forms Just me Personal, factual information; errors here have real consequences.

2. Toolkit Setup

Accounts created: Claude (claude.ai, free tier), ChatGPT (free tier), and Anthropic Academy. Enrolled in AI Fluency: Framework & Foundations on Anthropic Academy; completed Module 1 (see screenshot attached separately).

3. Claude Project — Custom Instructions

Created a Claude Project named "FlyRank Internship & CS Coursework" with the following custom instructions:

Who I am: 6th-semester CS student (BNU), currently a backend/configurator intern on a live e-commerce platform (Bizcard Print Hub), also working on a Final Year Project (AI study companion) and a solo Godot game project, and now doing the FlyRank AI Internship's Front-end AI Engineering track.

Tone preferences: direct and concise, plain-language explanations of why something matters, step-by-step instructions rather than abstract descriptions.

Current goals: complete the FlyRank Front-end AI Engineering track (5 assignments + capstone), keep steady progress on the Bizcard Print Hub backend/frontend work, and make consistent weekly progress on my FYP.

(Screenshot of the configured Project is attached separately as part of this submission.)

4. Three Target Audit Tasks (for FL-02 through FL-04)

1. Debugging live API/backend integration issues (Bizcard Print Hub)

Done well means: the root cause is correctly identified before a fix is attempted, the fix is verified against real live data (not assumptions), and no working functionality regresses — confirmed by re-testing the affected flow end-to-end in the browser.

2. Writing status updates/handoff documentation

Done well means: the update is accurate to what actually happened (no inflated or vague claims), is scannable in under 2 minutes, and leaves the reader able to act without needing to ask a follow-up question.

3. Godot/GDScript feature implementation for my solo game project

Done well means: the feature works as intended in-game on first manual playtest, the code follows my project's existing conventions, and I understand every line well enough to modify it later without AI help.

Here's a short summary of what you completed for **Task 2 (FL-02: AI Workflow Audit and Tool Setup)**:

Workflow audit:

- Built a 1–2 page table auditing 13 real recurring tasks from your actual week — spanning your Bizcard Print Hub internship work, FYP, Godot game project, and coursework.
- Classified each task (Just me / Delegate to AI with review / Collaborate with AI / Fully automate) with a one-line rationale.
- Honestly marked 3 tasks "Just me" with real reasons (debugging live API issues, verifying supplier data, manual browser testing).

Toolkit setup:

- Created free accounts on Claude and ChatGPT (already had these).
- Enrolled in Anthropic Academy's "AI Fluency: Framework & Foundations" course and completed the **entire course** (not just Module 1) — scored 10/10 (100%) on the quiz, covering the 4D framework (Delegation, Description, Discernment, Diligence).
- Earned an official Certificate of Completion (verifiable, backed by UCC, Ringling College, HEA).

Claude Project:

- Created a project named "FlyRank Internship & CS Coursework" with genuine custom instructions saved (who you are, tone preferences, current goals) — confirmed saved in the actual Instructions panel, not just typed into chat.

Three target tasks (for FL-02–FL-04) with success definitions:

1. Debugging live API/backend integration issues
2. Writing status updates/handoff documentation
3. Godot/GDScript feature implementation

Submitted: workflow audit docx, certificate PDF, and Claude Project screenshot — all attached and saved.

3. Draw the Path: Portfolio Sitemap + Toolkit

Deliverable 3 — Pressure test:

Sara Haider — AI Portfolio Build / Developer portfolio sitemap for FlyRank in Free plan · Upgrade × Share

I want to build my personal developer portfolio for my FlyRank internship.
My current portfolio idea is:
HOME
- Hero section
- Short proof statement
- Selected projects
- Main call-to-action
WORK / CASE STUDIES
- CarryClicks – Full-Stack E-Commerce Platform
- AI-Powered Surveillance System
- Melodies – Flutter Music App
- PBL Management System
ABOUT
- Short introduction
- Education
- Skills
CONTACT
- Email
- LinkedIn
- Contact form
My goal is to prove that I can build practical, responsive digital products through real projects rather than simply listing technologies.
Pressure-test this sitemap against my proof statement.
Act as my tutor, not just an assistant.
Tell me:

Scrutinized portfolio structure and challenged weak positioning assumptions

Good starting point — you've got the right instinct to organize around proof rather than a skills list. But let's actually stress-test it against your proof statement, because a few things here are more habit ("this is what portfolios have") than deliberate choices.

1. Which pages are necessary?

- HOME — yes. It's the filter that decides whether a visitor stays.

Write a message...
+  Sonnet 5 Medium  

Claude is AI and can make mistakes. Please double-check responses.

Deliverable 4 — Decision/change:

Change I made: I removed the standalone About page and integrated a short introduction into the Home page. I also decided not to create a fifth case study for freelance work because it would add unnecessary complexity without providing unique proof.

Goal: Build the foundation for an 8-week AI-fluency portfolio challenge — a sitemap, a Claude Project that follows you the whole way, and a real pressure-test of your thinking.

1. Sitemap

Sketched an initial 4-page idea (Home, Work, About, Contact), then used Claude to pressure-test it. Ended up cutting it to three pages:

- **Home** — hero, proof statement, short intro (incl. brief freelance mention), selected projects, CTA → Work
- **Work** — four case studies (CarryClicks e-commerce, AI-Powered Surveillance System, Melodies Flutter app, PBL Management System/ERP), each ending with a CTA → Contact
- **Contact** — email + LinkedIn, no contact form

2. Toolkit

Set up accounts across Claude, ChatGPT, Gemini, and Perplexity.

3. Claude Project

Created "Sara Haider — AI Portfolio Build" with genuine custom instructions — your proof statement pasted in, and a request for Claude to act as a tutor (challenge assumptions, keep things simple, explain the "why" behind decisions) rather than just generate content. This project is meant to carry through all 8 weeks.

4. Pressure test

Ran a real prompt asking Claude to stress-test the original 4-page sitemap against your proof statement. Claude pushed back on two things:

- A standalone About page — risked becoming a bio/skills list rather than proof
- A contact form — added friction without proving anything a case study couldn't

5. Change made

Based on that pushback, you folded the About content into Home as a short intro, and decided against a 5th case study for freelance work (kept it minimal, mentioned briefly on Home instead).

4. What Are You Proving?

Here's a small summary of the "What Are You Proving?" task:

Goal: Nail down one specific claim, one specific person, and one specific action — the foundation everything else in the portfolio builds on.

What happened: You started torn between two strengths from Melodies (your Flutter app) — building functional logic vs. designing the interface — and initially wanted to claim both. Working through it, you picked **building functional Flutter apps** as the one true claim, since that's the part you'd rather keep doing, not just something you're capable of.

Final answers:

- **Claim:** I build functional, working Flutter mobile apps
- **Person:** Someone at FlyRank reviewing your internship
- **Action:** Download my CV

1. **Proof statement:**

"I build functional, working Flutter mobile apps — not just interfaces that look good, but apps where the logic underneath actually works. My proof is Melodies, a music app I built end-to-end in Flutter and Android Studio. If you're reviewing my FlyRank internship work, download my CV to see the range of projects behind this."

2. **Why this needs to exist:**

"A CV or LinkedIn can say I know Flutter — it can't show you a working app I actually shipped."
